How Does Kentucky Compare to Other States?

Workers across the country were hit hard during the recent recession. Since then, employment in some states has returned to pre-recession levels, while employment in other states remains below pre-recession levels. The chart below allows for a comparison of Kentucky to other states using two metrics.

The unemployment rate (measured along the horizontal axis) serves as a gauge of current labor-market conditions in Kentucky, while net job gains since the recession began (current nonfarm jobs as a share of jobs prior to the recession) measures progress toward labor-market recovery (vertical axis).

States falling in the upper left quadrant have net job gains since the start of the recession and unemployment rates lower than the national unemployment rate. States falling in the lower right quadrant have higher unemployment rates than the United States overall and are still experiencing net job losses relative to pre-recession levels.

Note: The figure above excludes North Dakota, which has a current unemployment rate of 2.6% and net job gains totaling 27.3% since the start of the recession.
