Statement of

Lisa N. Sacco
Analyst in Illicit Drugs and Crime Policy

Before

Joint Economic Committee
U.S. Joint Committee

Hearing on

“Economic Aspects of the Opioid Crisis”

June 8, 2017
Overview

Chairman Tiberi, Vice-Chairman Lee, Ranking Member Heinrich, and distinguished Members of the Committee, my name is Lisa Sacco, and I am a CRS analyst on crime and drug policy. Thank you very much for inviting me to speak with you. My testimony will focus on the supply of heroin and other opioids in the United States.

Heroin, fentanyl, and controlled prescription drugs have been ranked as the most significant drug threats to the United States.\(^1\) While the reported availability of controlled prescription drugs has declined over the last several years, the reported availability of heroin has increased substantially. Further, there has been a rise in the availability of illicit fentanyl pressed into counterfeit prescription opioid pills.\(^2\) The availability of these drugs contributes to rising consumption.\(^3\)

The supply of heroin and other opioids varies by region of the United States. More than 60% of National Drug Threat Survey (NDTS) respondents in the Northeast, Midwest, and Mid-Atlantic reported high availability of heroin in their areas while just over 20% of respondents in the Southwest and Southeast reported high availability.\(^4\) Availability can vary within regions as well. For example, in 2015, the Drug Enforcement Administration (DEA) Field Division in Dallas reported high availability of controlled prescription drugs, while El Paso and Houston reported only moderate availability.\(^5\)

Historically, the federal government has concentrated on reducing the supply of illicit drugs, but in recent years, efforts for drug treatment and prevention have increased.\(^6\)

Brief History of Opioid Supply in the United States, 1990s-2017

Opioids have been available in the United States since the 1800s, but the market for these drugs shifted significantly beginning in the 1990s. This testimony focuses on this latter period (see Figure 1).

---

5. Ibid., p. 26. Controlled prescription drugs include opioids, amphetamines, and other controlled substances.
**Prescription Drug Supply**

In the 1990s, the availability of prescription opioids, including opioids such as hydrocodone and oxycodone, increased as the legitimate production of these drugs and diversion increased sharply. This continued into the early 2000s as abusers attained their prescription drugs through “doctor shopping,” bad-acting physicians, pill mills, the Internet, pharmaceutical theft, prescription fraud, and through family and friends.

**Government Response to Proliferation of Prescription Drugs**

Lawmakers undertook a range of approaches to reduce the unlawful prescription drug supply and abuse: diversion control through prescription drug monitoring programs, a crackdown on pill mills, the

8 One such doctor was David Procter who established a pill mill operation from 1992 through 2001 in South Shore, Kentucky. He is viewed as the “godfather of pills.” See “How Heroin Made its Way From Rural Mexico to Small-Town America,” *NPR*, May 19, 2015.
9 For more information on prescription drug monitoring programs, see CRS Report R42593, *Prescription Drug Monitoring Programs*, by Lisa N. Sacco, Erin Bagalman, and Kristin Finklea.
increased regulation of Internet pharmacies in 2008, the reformulation of OxyContin® (oxycodone hydrochloride controlled-release) in 2010, and the rescheduling of hydrocodone in 2014.

Some experts have highlighted the connection between the crackdown on the unlawful supply of prescription drugs and the subsequent rise in heroin supply and abuse. Heroin is a cheaper alternative to prescription drugs that is often more accessible to some who are seeking an opioid high. While most users of prescription drugs will not go on to use heroin, accessibility and price are central factors cited by patients with opioid dependence in their decision to turn to heroin.

**Heroin Supply**

The trajectory of the heroin supply over the last several decades is much different compared to prescription opioids, but the stories of their supply are connected. In the late 1990s and early 2000s, white powder heroin produced in South America dominated the market east of the Mississippi River, and black tar and brown powder heroin produced in Mexico dominated the market west of the Mississippi. Most of the heroin destined for the United States at that time came from South America, while smaller percentages were from Mexico and Southwest Asia.

Price and purity varied considerably by region. The average retail-level purity of South American heroin was around 46 percent, which was considerably higher than that of Mexican, Southeast Asian, or Southwest Asian heroin. At that time, Mexican heroin was around 27 percent pure, while Southeast and Southwest Asian heroin were around 24 and 30 percent pure respectively. Prices for heroin fell dramatically in the 1990s—heroin prices were 55 to 65% lower in 1999 than prices in 1989.

---

10 In response to the problem of rogue Internet websites that illegally sell and dispense controlled prescription drugs, Congress passed the Ryan Haight Online Pharmacy Consumer Protection Act of 2008 (P.L. 110-425) which amended the Controlled Substances Act to expressly regulate online pharmacies. For more information, see CRS Report R43559, Prescription Drug Abuse, by Erin Bagalman et al.

11 The Food and Drug Administration (FDA) approved the reformulation of OxyContin® to make it harder to crush and abuse. The FDA also required a label warning of its addictive quality.

12 On August 22, 2014, the Drug Enforcement Administration published a final rule in the Federal Register that administratively reschedules hydrocodone combination products from Schedule III to Schedule II, which subjects anyone who manufactures, distributes, or dispenses hydrocodone combination products to the more stringent regulatory requirements and administrative, civil, and criminal sanctions that are applicable to Schedule II controlled substances. For more information on these actions, see CRS Report R43559, Prescription Drug Abuse, by Erin Bagalman et al.

14 National Institute on Drug Abuse, Prescription Drugs and Heroin, December 2015, pp. 4-5.

15 Heroin has several different forms including black tar, brown powder, and white powder. For more information, see Drug Enforcement Administration, Drugs of Abuse, 2015 Edition, p. 38.

Over the last several years, heroin prices have further declined while purity, in particular the purity of Mexican heroin, has increased. The availability of Mexican heroin has also grown. Over 90% of the heroin seized now is from Mexico and a much smaller portion is from South America. Mexico dominates the U.S. heroin market because of its proximity to the U.S. and its established transportation and distribution infrastructure, which improves traffickers’ ability to satisfy U.S. heroin demand. Increases in Mexican heroin production have ensured a reliable supply of low-cost heroin, even as demand for these drugs has increased. Mexican traffickers have particularly increased their production of white powder heroin and may be targeting those who abuse prescription opioids.  

Fentanyl Supply

Compounding the current opioid problem is the introduction of non-pharmaceutical fentanyl to the black market. Diverted pharmaceutical fentanyl represents only a small portion of the fentanyl market. Non-pharmaceutical fentanyl largely comes from China, and it is often mixed with or sold as heroin. It is 50 to 100 times more potent than heroin, and over the last two years, reported prices ranged between $30,000 and $38,000 per kilogram. The increased potency of synthetic fentanyl compounds, such as the recently-emerged, so-called “gray death,” are extremely dangerous, and law enforcement expect that the fentanyl market will continue to expand in the future as new fentanyl products attract additional users.

Supply of Opioids Across the United States

The supply of opioids varies by region of the United States. In 2016, approximately 45 percent of National Drug Threat Survey respondents reported heroin as the greatest drug threat in their area. In contrast, 8 percent of respondents reported heroin as the greatest threat in 2007. Reports of heroin as the greatest threat are concentrated in the Northeast, Midwest, and Mid-Atlantic regions.

Opioids are the main cause of drug overdose deaths. Reports indicate that increases in overdose deaths are most likely driven by illicitly-manufactured fentanyl and heroin. The increasing availability of heroin throughout the United States largely, but not entirely, corresponds to high drug overdose deaths (see Figure 2). For example, New Mexico and Utah rank 8th and 9th, respectively, in the country in drug overdose deaths, but only 4.7 percent of NDTS respondents in the Southwest reported heroin as the greatest drug threat and 22.6 percent reported high availability of heroin in their region. This discrepancy may be explained by a number of factors including the lethality of fentanyl.

(...continued)

19 Gray death is a new illicit synthetic opioid mix that is reportedly 10,000 times more powerful than morphine. The ingredients of seized samples have varied.

Federal Drug Control Spending and Recent Legislation

Historically, the federal government has concentrated on reducing the supply of illicit drugs, but in recent years, increased efforts have been placed on reducing demand. Federal drug control dollars largely go toward reducing supply, however, federal drug control funding for supply reduction has remained relatively flat over the last several years while funding for drug treatment and prevention has increased (see Table 1).

Similarly, over the last year, Congress has enacted comprehensive legislation—for example, the Comprehensive Addiction and Recovery Act (CARA; P.L. 114-198) and the 21st Century Cures Act (P.L. 114-255)—that promotes prevention, treatment, and law enforcement methods to address the opioid problem.
